A Survey of Invertebrates of Jackson Hole
Donald C. Lowrie
Los Angeles State College
Project Number 91

This research project was set up with the idea of getting a representative collection of the invertebrates of the area since apparently, except for certain groups such as spiders and molluscs, very little work had been done on the invertebrates. We expect to continue this study until our information on the invertebrates is comparable to that already available on the vertebrates of the area.

Collecting was done in various habitats including Swan Lake and above timber-line, and considerable sweeping was done on vegetation in lodgepole pine and in the meadows. A total of 3,265 insects including 565 species were collected. The following Orders of insects were represented: Lepidoptera, Trichoptera, Odonata, Orthoptera, Homoptera, Heteroptera, Coleoptera, Diptera, Hymenoptera.

Supported by a grant from the New York Zoological Society.
