A NEW SOLVABLE CONDITION FOR A PAIR OF GENERALIZED SYLVESTER EQUATIONS

QING WEN WANG†, HUA-SHENG ZHANG‡, AND GUANG-JING SONG§

Abstract. A necessary and sufficient condition is given for the quaternion matrix equations $A_iX + YB_i = C_i$ ($i = 1, 2$) to have a pair of common solutions $X$ and $Y$. As a consequence, the results partially answer a question posed by Y.H. Liu (Y.H. Liu, Ranks of solutions of the linear matrix equation $AX + YB = C$, Comput. Math. Appl., 52 (2006), pp. 861-872).

Key words. Quaternion matrix equation, Generalized Sylvester equation, Generalized inverse, Minimal rank, Maximal rank.

AMS subject classifications. 15A03, 15A09, 15A24, 15A33.

1. Introduction. Throughout this paper, we denote the real number field by $\mathbb{R}$, the complex number field by $\mathbb{C}$, the set of all $m \times n$ matrices over the quaternion algebra

$$
\mathbb{H} = \{a_0 + a_1i + a_2j + a_3k \mid \ i^2 = j^2 = k^2 = ijk = -1, \ a_0, a_1, a_2, a_3 \in \mathbb{R}\}
$$

by $\mathbb{H}^{m \times n}$, the identity matrix with the appropriate size by $I$, the transpose of a matrix $A$ by $A^T$, the column right space, the row left space of a matrix $A$ over $\mathbb{H}$ by $\mathcal{R}(A), \mathcal{N}(A)$, respectively, a reflexive inverse of a matrix $A$ by $A^+$ which satisfies simultaneously $AA^+A = A$ and $A^+AA^+ = A^+$. Moreover, $R_A$ and $L_A$ stand for the two projectors $L_A = I - A^+A$, $R_A = I - AA^+$ induced by $A$. By [1], for a quaternion matrix $A$, $\dim \mathcal{R}(A) = \dim \mathcal{N}(A)$, which is called the rank of $A$ and denoted by $r(A)$.

Many problems in systems and control theory require the solution of the generalized Sylvester matrix equation $AX + YB = C$. Roth [2] gave a necessary and sufficient condition for the consistancy of this matrix equation, which was called Roth’s theorem on the equivalence of block diagonal matrices. Since Roth’s paper appeared

in 1952, Roth’s theorem has been widely extended (see, e.g., [2]-[16]). Perturbation analysis of generalized Sylvester eigenspaces of matrix quadruples [17] leads to a pair of generalized Sylvester equations of the form

\[(1.1)\quad A_1X + YB_1 = C_1, \quad A_2X + YB_2 = C_2.\]

In 1994, Wimmer [12] gave a necessary and sufficient condition for the consistency of (1.1) over \(\mathbb{C}\) by matrix pencils. In 2002, Wang, Sun and Li [14] established a necessary and sufficient condition for the existence of constant solutions with bi(skew)symmetric constrains to (1.1) over a finite central algebra. Liu [16] in 2006 presented a necessary and sufficient condition for the pair of equations in (1.1) to have a common solution \(X\) or \(Y\) over \(\mathbb{C}\), respectively, and proposed an open problem: find a necessary and sufficient condition for system (1.1) to have a pair of solutions \(X\) and \(Y\) by ranks.

Motivated by the work mentioned above and keeping applications and interests of quaternion matrices in view (e.g., [18]-[34]), in this paper we investigate the above open problem over \(\mathbb{H}\). In Section 2, we establish a necessary and sufficient condition for (1.1) to have a pair of solutions \(X\) and \(Y\) over \(\mathbb{H}\). In section 3, we present a counterexample to illustrate the errors in Liu’s paper [16]. A conclusion and a further research topic related to (1.1) are also given.

### 2. Main results

The following lemma is due to Marsaglia and Styan [35], which can also be generalized to \(\mathbb{H}\).

**Lemma 2.1.** Let \(A \in \mathbb{H}^{m \times n}\), \(B \in \mathbb{H}^{m \times k}\) and \(C \in \mathbb{H}^{l \times n}\). Then they satisfy the following:

(a) \(r[AB] = r(A) + r(R_A B) = r(B) + r(R_B A).\)

(b) \(r\begin{bmatrix} A \\ C \end{bmatrix} = r(A) + r(CL_A) = r(C) + r(AL_C).\)

(c) \(r\begin{bmatrix} A & B \\ C & 0 \end{bmatrix} = r(B) + r(C) + r(R_B AL_C).\)

From Lemma 2.1 we can easily get the following.

**Lemma 2.2.** Let \(A \in \mathbb{H}^{m \times n}\), \(B \in \mathbb{H}^{m \times k}\), \(C \in \mathbb{H}^{l \times n}\), \(D \in \mathbb{H}^{j \times k}\) and \(E \in \mathbb{H}^{l \times i}\). Then

(a) \(r(CL_A) = r\begin{bmatrix} A \\ C \end{bmatrix} - r(A).\)

(b) \(r\begin{bmatrix} B & AL_C \\ 0 & C \end{bmatrix} = r\begin{bmatrix} B & A \\ 0 & C \end{bmatrix} - r(C).\)

(c) \(r\begin{bmatrix} C \\ R_B A \end{bmatrix} = r\begin{bmatrix} C \\ A & B \end{bmatrix} - r(B).\)
A New Solvable Condition for a Pair of Generalized Sylvester Equations

\[(d) \quad r \begin{bmatrix} A & B \vspace{1pt} \\vspace{1pt} D \\
R & \vspace{1pt} E \vspace{1pt} & 0 \\ 0 & 0 & 0 \end{bmatrix} = r \begin{bmatrix} A & B & 0 \\
C & 0 & E \\
0 & D & 0 \end{bmatrix} - r(D) - r(E).\]

The following three lemmas are due to Baksalary and Kala [6], Tian [36],[37], respectively, which can be generalized to \(\mathbb{H}\).

**Lemma 2.3.** Let \(A \in \mathbb{H}^{m \times p}, B \in \mathbb{H}^{q \times n}\) and \(C \in \mathbb{H}^{m \times n}\) be known and \(X \in \mathbb{H}^{p \times q}\) unknown. Then the matrix equation \(AX + YB = C\) is solvable if and only if

\[r \begin{bmatrix} B & A \\
0 & C \end{bmatrix} = r(A) + r(B).\]

In this case, the general solution to the matrix equation is given by

\[X = A^+C + UB + LAV,\]
\[Y = RCA - AU + LAWRB,\]

where \(U \in \mathbb{H}^{p \times q}, V \in \mathbb{H}^{p \times n}\) and \(W \in \mathbb{H}^{m \times q}\) are arbitrary.

**Lemma 2.4.** Let \(A \in \mathbb{H}^{m \times n}, B \in \mathbb{H}^{m \times p}, C \in \mathbb{H}^{p \times n}\) be given, \(Y \in \mathbb{H}^{p \times n}, Z \in \mathbb{H}^{m \times q}\) be two variant matrices. Then

\[\max_{Y,Z} r(A - BY - ZC) = \min \left\{m, n, r \begin{bmatrix} A & B \\
C & 0 \end{bmatrix} \right\};\]

\[\min_{Y,Z} r(A - BY - ZC) = r \begin{bmatrix} A & B \\
C & 0 \end{bmatrix} - r(B) - r(C).\]

**Lemma 2.5.** The matrix equation \(A_1X_1B_1 + A_2X_2B_2 + A_3Y + ZB_3 = C\) is solvable if and only if the following four rank equalities are all satisfied:

\[r \begin{bmatrix} C & A_1 & A_2 & A_3 \\
B_3 & 0 & 0 & 0 \end{bmatrix} = r[A_1, A_2, A_3] + r(B_3),\]

\[r \begin{bmatrix} C & A_3 \\
B_1 & 0 \\
B_2 & 0 \\
B_3 & 0 \end{bmatrix} = r(A_3) + r \begin{bmatrix} B_1 \\
B_2 \\
B_3 \end{bmatrix},\]

\[r \begin{bmatrix} C & A_1 & A_3 \\
B_2 & 0 & 0 \\
B_3 & 0 & 0 \end{bmatrix} = r \begin{bmatrix} B_2 \\
B_3 \end{bmatrix} + r[A_1, A_3],\]

Electronic Journal of Linear Algebra  ISSN 1081-3810
A publication of the International Linear Algebra Society
Volume 18, pp. 289-301, June 2009

http://math.technion.ac.il/iic/ela
Then $V$ are reflexive inverses of $A$ and $B$, respectively.

**Lemma 2.7.** Suppose $A_1, A_2 \in \mathbb{H}^{m \times p}, B_1, B_2 \in \mathbb{H}^{q \times n}$ and $\hat{B} = \begin{bmatrix} B_1 \\ B_2 \end{bmatrix}$ are given, $V = \begin{bmatrix} V_1 \\ V_2 \end{bmatrix}$ and $W = \begin{bmatrix} W_1 \\ W_2 \end{bmatrix}$ are any matrices with compatible dimensions. Then

(a) $[I_p, 0] L_{[A_1, A_2]} V$ and $[0, I_p] L_{[A_1, A_2]} V$ are independent, that is, for any $V = \begin{bmatrix} V_1 \\ V_2 \end{bmatrix}$, $[I_p, 0] L_{[A_1, A_2]} V$ only relates to $V_2$ and the change of $[0, I_p] L_{[A_1, A_2]} V$ only relates to $V_1$, if and only if

$$r [A_1, A_2] = r (A_1) + r (A_2).$$

(b) $WR_{\hat{B}} \begin{bmatrix} I_q \\ 0 \end{bmatrix}$ and $WR_{\hat{B}} \begin{bmatrix} 0 \\ I_q \end{bmatrix}$ are independent, that is, for any $W = \begin{bmatrix} W_1 \\ W_2 \end{bmatrix}$, $WR_{\hat{B}} \begin{bmatrix} I_q \\ 0 \end{bmatrix}$ only relates to $W_1$ and $WR_{\hat{B}} \begin{bmatrix} 0 \\ I_q \end{bmatrix}$ only relates to $W_2$, if and only if

$$r \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = r (B_1) + r (B_2).$$

**Proof.** From Lemma 2.6, we have

$$[I_p, 0] L_{[A_1, A_2]} V = [I_p, 0] \left( I - \begin{bmatrix} A_1^+ - A_1^+ A_2 ([I - A_1 A_1^+] A_2)^+ (I - A_1 A_1^+) \\ ([I - A_1 A_1^+] A_2)^+ (I - A_1 A_1^+) \end{bmatrix} [A_1, A_2] \right) V$$

$$= [I_p, 0] \left( I - \begin{bmatrix} A_1 A_1^+ A_2 - A_1 A_2 \end{bmatrix} ([I - A_1 A_1^+] A_2)^+ (I - A_1 A_1^+) A_2 \right) \left( V_1 \right)$$

$$= V_1 - \begin{bmatrix} A_1 A_1^+ A_2 - A_1 A_2 \end{bmatrix} \left( [I - A_1 A_1^+] A_2)^+ (I - A_1 A_1^+) A_2 \right) \left( \begin{bmatrix} V_1 \\ V_2 \end{bmatrix} \right).$$
Similarly, we have
\[
[0, I_p] L_{[A_1, A_2]} V = V_2 - [0, [(I - A_1 A_1^+) A_2]^+(I - A_1 A_1^+) A_2] \begin{bmatrix} V_1 \\ V_2 \end{bmatrix}.
\]
Thus, \([I_p, 0] L_{[A_1, A_2]} V\) and \([0, I_p] L_{[A_1, A_2]} V\) are independent if and only if
\[
A_1^+ A_2 - A_1^+ A_2 [(I - A_1 A_1^+) A_2]^+(I - A_1 A_1^+) A_2 = 0.
\]

According to Lemma 2.2, we have
\[
\begin{align*}
&\quad r [A_1, A_2] - A_1^+ A_2[(I - A_1 A_1^+) A_2]^+(I - A_1 A_1^+) A_2) \\
&= r \begin{bmatrix} A_2 \\ A_1 \\ A_2 \end{bmatrix} - r [A_2, A_1] \\
&= r \begin{bmatrix} A_2 \\ 0 \\ A_1 \end{bmatrix} - r [A_2, A_1].
\end{align*}
\]
That is \(r [A_1, A_2] = r (A_1) + r (A_2)\).

Similarly, we can prove (b).

Now we give the main result of this article.

**THEOREM 2.8.** Suppose that every matrix equation in system (1.1) is consistent and
\[
(2.3) \quad r [A_1, A_2] = r (A_1) + r (A_2), r \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = r (B_1) + r (B_2).
\]
Then system (1.1) has a pair of solutions \(X\) and \(Y\) if and only if
\[
(2.4) \quad r \begin{bmatrix} B_1 \\ 0 \\ -C_1 \\ A_1 \\ C_2 \end{bmatrix} = r \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} + r \begin{bmatrix} B_1 \\ B_2 \end{bmatrix},
\]
\[
(2.5) \quad r \begin{bmatrix} A_1 \\ 0 \\ -C_1 \\ A_1 \\ B_1 \\ B_2 \end{bmatrix} = r [A_1, A_2] + r [B_1, B_2],
\]
\[
(2.6) \quad r \begin{bmatrix} 0 \\ A_1 \\ 0 \\ A_2 \\ 0 \\ F \end{bmatrix} = r \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} + r [B_1, B_2],
\]
Q.W. Wang, H.S. Zhang, and G.J. Song

\[ r \begin{bmatrix} 0 & B_1 & B_2 \\ A_1 & 0 & 0 \\ A_2 & 0 & \hat{F} \end{bmatrix} = r \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} + r[B_1, B_2], \]

where

\[ F = A_1 \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix} + \Omega B_1 \]

and

\[ \hat{F} = A_2 \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix} + \Omega B_2 \]

with \( \Omega = [-A_1, A_2] [-A_1, A_2]^+ \left( R_{A_2} C_2 B_2^+ - R_{A_1} C_1 B_1^+ \right) \).

\textbf{Proof.} Clearly, system (1.1) has a pair of solutions \( X \) and \( Y \) if and only if

\[ A_1 X_1 + Y_1 B_1 = C_1 \]
\[ A_2 X_2 + Y_2 B_2 = C_2 \]

are consistent and \( X_1 = X_2 \) and \( Y_1 = Y_2 \). It follows from Lemma 2.3 that \( A_1 X_i + Y_i B_i = C_i, i = 1, 2 \), are consistent if and only if

\[ C_i - A_i A_i^+ C_i - C_i B_i^+ B_i + A_i A_i^+ C_i B_i^+ B_i = 0, i = 1, 2. \]

In that case, the general solutions can be written as

\[ X_i = A_i^+ C_i + U_i B_i + L_{A_i} V_i, \]
\[ Y_i = R_{A_i} C_i - A_i U_i + L_{A_i} W_i R_{B_i}, \]

where \( U_i \in \mathbb{H}^{p \times q}, V_i \in \mathbb{H}^{p \times n}, W_i \in \mathbb{H}^{m \times q}, i = 1, 2 \), are arbitrary. Hence,\n
\[ X_1 - X_2 = A_1^+ C_1 - A_2^+ C_2 + [U_1, U_2] \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix} + [L_{A_1}, -L_{A_2}] \begin{bmatrix} V_1 \\ V_2 \end{bmatrix}, \]
\[ Y_1 - Y_2 = R_{A_1} C_1 B_1^+ - R_{A_2} C_2 B_2^+ + [-A_1, A_2] \begin{bmatrix} U_1 \\ U_2 \end{bmatrix} + [W_1, W_2] \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix}. \]

Obviously, the equations (2.10) and (2.11) have common solutions, \( X_1 = X_2, Y_1 = Y_2 \), if and only if there exist \( U_1 \) and \( U_2 \) in (2.14) and (2.15) such that

\[ \min_{A_1 X_1 + Y_1 B_1 = C_1, A_2 X_2 + Y_2 B_2 = C_2} r(X_1 - X_2) = 0, \]
\[ \min_{A_1 X_1 + Y_1 B_1 = C_1, A_2 X_2 + Y_2 B_2 = C_2} r(Y_1 - Y_2) = 0. \]
which is equivalent to the existence of $U_1$ and $U_2$ such that

$$(2.18) \quad A_1^+ C_1 - A_2^+ C_2 + [U_1, U_2] \begin{bmatrix} B_1 & L_{A_1}, -L_{A_2} \\ -B_2 & V_1 \\ \end{bmatrix} V_2 = 0,$$

and

$$(2.19) \quad R_{A_1} C_1 B_1^+ - R_{A_2} C_2 B_2^+ + [-A_1, A_2] \begin{bmatrix} U_1 \\ U_2 \end{bmatrix} + [W_1, W_2] \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} = 0.$$

It follows from (2.16-2.17) and Lemma 2.3 that

$$(2.20) \quad \min_{A_1 X_1 + Y_1 B_1 = C_1, A_2 X_2 + Y_2 B_2 = C_2} r \begin{bmatrix} X_1 - X_2 \end{bmatrix} = r \begin{bmatrix} B_1 & 0 \\ B_2 & 0 \\ -C_1 & A_1 \\ C_2 & A_2 \end{bmatrix} - \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} - r \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = 0$$

and

$$(2.21) \quad \min_{A_1 X_1 + Y_1 B_1 = C_1, A_2 X_2 + Y_2 B_2 = C_2} r \begin{bmatrix} Y_1 - Y_2 \end{bmatrix} = r \begin{bmatrix} A_1 & A_2 \\ 0 & 0 \\ -C_1 & B_1 \\ C_2 & B_2 \end{bmatrix} - r \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} - r \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = 0$$

implying, from Lemma 2.3, that (2.18) and (2.19) are solvable for $[U_1, U_2]$ and $[U_1, U_2]$, respectively, and

$$(2.22) \quad [U_1, U_2] = R_{L_{A_1}, -L_{A_2}} (A_2^+ C_2 - A_1^+ C_1) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix} + [L_{A_1}, -L_{A_2}] \tilde{U} + WR_B,$$

and

$$(2.23) \quad \begin{bmatrix} U_1 \\ U_2 \end{bmatrix} = [-A_1, A_2]^+ (R_{A_2} C_2 B_2^+ - R_{A_1} C_1 B_1^+) + \tilde{U} \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} + L_{[-A_1, A_2]} V,$$

where $\tilde{U}, \tilde{U}, W$ and $V$ are any matrices over $\mathbb{H}$ with appropriate dimensions. Clearly,

$$(2.24) \quad [U_1, U_2] \begin{bmatrix} I_q \\ 0 \end{bmatrix} = [I_p, 0] \begin{bmatrix} U_1 \\ U_2 \end{bmatrix},$$
Q.W. Wang, H.S. Zhang, and G.J. Song

and

\[(2.25) \quad [U_1, U_2] \begin{bmatrix} 0 \\ I_q \end{bmatrix} = [0, I_p] \begin{bmatrix} U_1 \\ U_2 \end{bmatrix}.\]

Substituting (2.22) and (2.23) into (2.24) and (2.25) yields

\[(2.26) R_{[L_{A_1}, -L_{A_2}]} \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} I_q \\ 0 \end{bmatrix} - [I_p, 0] \alpha \]

\[= [L_{A_1}, -L_{A_2}] \tilde{U} \begin{bmatrix} I_q \\ 0 \end{bmatrix} + [I_p, 0] \tilde{U} \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} - W R_{\tilde{B}} \begin{bmatrix} I_q \\ 0 \end{bmatrix} + [I_p, 0] L_{[-A_1, A_2]} V, \]

and

\[(2.27) R_{[L_{A_1}, -L_{A_2}]} \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} 0 \\ I_q \end{bmatrix} - [I_p, 0] \alpha \]

\[= [L_{A_1}, -L_{A_2}] \tilde{U} \begin{bmatrix} 0 \\ I_q \end{bmatrix} + [I_p, 0] \tilde{U} \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} - W R_{\tilde{B}} \begin{bmatrix} 0 \\ I_q \end{bmatrix} + [I_p, 0] L_{[-A_1, A_2]} V, \]

where

\[\alpha = [-A_1, A_2]^+ \left( R_{A_2} C_2 B_2^+ - R_{A_1} C_1 B_1^+ \right), \quad \tilde{B} = \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}.\]

Let

\[\tilde{U} = \tilde{U}_1, \tilde{U}_2, \tilde{U}_1 \text{ and } \tilde{U}_2 \text{ are matrices over } \mathbb{H} \text{ with appropriate dimensions. Then it follows from (2.3) and Lemma 2.7 that (2.26) and (2.27) can be written as}\]

\[(2.28) \quad R_{[L_{A_1}, -L_{A_2}]} \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} I_q \\ 0 \end{bmatrix} - [I_p, 0] \alpha \]

\[= [L_{A_1}, -L_{A_2}] \tilde{U}_1 + \tilde{U}_1 \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} - W_{1R_{B_2}L_{B_1}} + V_{1R_{A_1}}, \]

and

\[(2.29) \quad R_{[L_{A_1}, -L_{A_2}]} \left( A_2^+ C_2 - A_1^+ C_1 \right) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} 0 \\ I_q \end{bmatrix} - [0, I_p] \alpha \]

\[= [L_{A_1}, -L_{A_2}] \tilde{U}_2 + \tilde{U}_2 \begin{bmatrix} R_{B_1} \\ -R_{B_2} \end{bmatrix} - W_{2L_{B_1}} + V_{2L_{R_{A_1}A_2}}. \]
Therefore, the equations (2.10) and (2.11) have common solutions, \(X_1 = X_2, Y_1 = Y_2\), if and only if there exist \(W_1, V_1, \hat{U}_1, \hat{U}_2; W_2, V_2, \hat{U}_2, \hat{U}_2\) such that (2.28) and (2.29) hold, respectively. By Lemma 2.5, the equation (2.28) is solvable if and only if

\[
(2.30) \quad r \left[ \begin{array}{cccc}
C & [L_{A_1}, -L_{A_2}] & [I_p, 0] & L_{[-A_1, A_2]} \\
R_{B_1} & 0 & 0 \\
-R_{B_2} & 0 & 0 \\
R_{\bar{B}} & -I_q & 0 \\
\end{array} \right] = r \left[ \begin{array}{cccc}
R_{B_1} & 0 & 0 & 0 \\
-R_{B_2} & 0 & 0 & 0 \\
-R_{B_2} & 0 & 0 & 0 \\
-R_{B_2} & 0 & 0 & 0 \\
\end{array} \right] + r([L_{A_1}, -L_{A_2}], [I_p, 0] L_{[-A_1, A_2]}),
\]

where

\[
C = \left( I - [L_{A_1}, -L_{A_2}] [L_{A_1}, -L_{A_2}]^+ \right) \left( A_2^+ C_2 - A_1^+ C_1 \right) \left[ \begin{array}{c} B_1 \\
B_2 \\
\end{array} \right]^+ \left[ \begin{array}{c} I_q \\
0 \\
\end{array} \right] - [I_p, 0] [-A_1, A_2]^+ \left( R_{A_2} C_2 B_2^+ - R_{A_1} C_1 B_1^+ \right).
\]

It follows from Lemma 2.2, (2.8) and block Gaussian elimination that

\[
(2.30) \quad r \left[ \begin{array}{cccc}
C & [L_{A_1}, -L_{A_2}] & [I_p, 0] & L_{[-A_1, A_2]} \\
R_{B_1} & 0 & 0 & 0 \\
-R_{B_2} & 0 & 0 & 0 \\
R_{\bar{B}} & -I_q & 0 & 0 \\
\end{array} \right] = r \left[ \begin{array}{cccc}
C & L_{A_1} & -L_{A_2} & I_p & 0 & 0 \\
R_{B_1} & 0 & 0 & 0 & 0 & 0 \\
-R_{B_2} & 0 & 0 & 0 & 0 & 0 \\
-I_q & 0 & 0 & 0 & 0 & B_1 \\
0 & 0 & 0 & 0 & 0 & -B_2 \\
0 & 0 & 0 & -A_1 & A_2 & 0 \\
\end{array} \right] - r [-A_1, A_2] - r \left[ \begin{array}{c} B_1 \\
B_2 \\
\end{array} \right]
\]

\[
= r \left[ \begin{array}{ccc}
0 & B_1 & B_2 \\
A_1 & 0 & 0 \\
A_2 & 0 & F \\
\end{array} \right] + p + q - r [-A_1, A_2] - r \left[ \begin{array}{c} B_1 \\
B_2 \\
\end{array} \right],
\]

\[
r \left[ \begin{array}{cc}
R_{B_1} & 0 \\
-R_{B_2} & 0 \\
\end{array} \right] = r [B_1, B_2] + q - r (B_1) - r (B_2),
\]

\[
r \left[ \begin{array}{cc}
R_{\bar{B}} & -I_q \\
-R_{\bar{B}} & 0 \\
\end{array} \right] = r [B_1, B_2] + q - r (B_1) - r (B_2),
\]
r \left[ [L_{A_1} - L_{A_2}], [I_p, 0] L_{[-A_1, A_2]} \right] = r \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} + p - r (A_1) - r (A_2)

implying that (2.6) follows from (2.3) and (2.30).

Similarly, the equation (2.29) is solvable if and only if

\[ r \begin{bmatrix} \hat{C} & J \\ R_{B_1} & 0 \\ -R_{B_2} & I_q \\ R_{\tilde{B}} & 0 \end{bmatrix} = r \begin{bmatrix} R_{B_1} \\ -R_{B_2} \\ 0 \\ R_{\tilde{B}} \end{bmatrix} + r (J, K), \]

where

\[ J = [L_{A_1}, -L_{A_2}], K = [0, I_p] L_{[-A_1, A_2]}, \]

\[ \hat{C} = \left( I - [L_{A_1}, -L_{A_2}] [L_{A_1}, -L_{A_2}]^+ \right) (A_1^+ C_2 - A_1^+ C_1) \begin{bmatrix} B_1 \\ -B_2 \end{bmatrix}^+ \begin{bmatrix} 0 \\ I_q \end{bmatrix} - [0, I_p] [-A_1, A_2]^+ \left( R_{A_2} C_2 B_2^+ - R_{A_1} C_1 B_1^+ \right). \]

Simplifying (2.31) yields (2.7) from (2.3) and (2.9). Moreover, (2.4) and (2.5) follow from (2.20) and (2.21), respectively. This proof is completed.

Under an assumption, we have derived a necessary and sufficient condition for system (1.1) to have a pair of solutions \( X \) and \( Y \) over \( \mathbb{H} \) by ranks. The open problem in [16] is, therefore, partially solved. By the way, we find that Corollary 2.3 in [16] is wrong.

Now we present a counterexample to illustrate the error. We first state the wrong corollary mentioned above: Suppose that the complex matrix equation \( (A_0 + A_1 i) X + Y (B_0 + B_1 i) = (C_0 + C_1 i) \) is consistent. Then

(a) Equation \( (A_0 + A_1 i) X + Y (B_0 + B_1 i) = (C_0 + C_1 i) \) has a pair of real solutions \( X = X_0 \) and \( Y = Y_0 \) if and only if

\[ r \begin{bmatrix} B_0 \\ B_1 \\ C_0 \\ C_1 \end{bmatrix} = r \begin{bmatrix} A_0 \\ A_1 \end{bmatrix} + r \begin{bmatrix} B_0 \\ B_1 \end{bmatrix}, \]

\[ r \begin{bmatrix} A_0 \\ A_1 \\ C_0 \\ C_1 \end{bmatrix} = r [A_0, A_1] + r [B_0, B_1]. \]

A counterexample is as follows. Let

\[ A_0 = B_0 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, A_1 = B_1 = C_0 = 0, C_1 = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix}. \]
Then we have

\[
\begin{bmatrix}
B_0 & 0 \\
B_1 & 0 \\
C_0 & A_0 \\
C_1 & A_1
\end{bmatrix} = r
\begin{bmatrix}
A_0 & A_1 & C_0 & C_1 \\
0 & 0 & B_0 & B_1
\end{bmatrix} = 4,
\]

\[
\begin{bmatrix} A_0 \\ A_1 \end{bmatrix} = r
\begin{bmatrix} B_0 \\ B_1 \end{bmatrix} = r [A_0, A_1] = r [B_0, B_1] = 2,
\]

i.e. (2.32) and (2.33) hold. However, the following matrix equation

\[
\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} X + Y \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix}
\]

has no real solution obviously.

Similarly, we can give a counterexample to illustrate that the part (c) of Corollary 2.3 in [16] is also wrong.

Using the methods in this paper, we can correct the mistakes mentioned above. We are planning to present these corrections in a separate article.
