AND NICHOLAS PETROPOULOS<sup>§</sup>

**Abstract.** A new parallel division of polynomials by a common separable divisor over a perfect field is presented and this is done by expressing the remainders as derivatives of a unique polynomial. In order to get this result, a novel variant expression of the classical Lagrange–Sylvester Hermite interpolating polynomial has been utilised, although any known variant may be used. The above findings are utilized to obtain a number of new identities involving polynomial derivatives, including a closed formula for the semi-simple part of the Jordan decomposition of a matrix.

**Key words.** Euclidean polynomial division, Hermite interpolation, Semisimple part of a matrix.

**AMS subject classifications.** 12Y05, 15A21, 11C08, 65F30.

**1. Introduction.** The Hermite interpolation of total degree is described in the following theorem [1]:

**THEOREM 1.1.** *Given  $n$  distinct elements  $\lambda_0, \lambda_1, \dots, \lambda_{n-1}$  in a perfect field  $\mathbb{K}$ , positive integers  $m_i$ ,  $i = 0, \dots, n-1$ , and  $a_{ij} \in \mathbb{K}$  for  $0 \leq i \leq n-1$ ,  $0 \leq j \leq m_i-1$ , then there exists one and only one polynomial  $r \in \mathbb{K}[x]$  of degree less than  $\sum_{i=0}^{n-1} m_i$ , such that*

$$r^{(j)}(\lambda_i) = a_{ij}, \quad 0 \leq j \leq m_i - 1, \quad 0 \leq i \leq n - 1. \quad (1.1)$$

*This polynomial  $r$  is explicitly given by,*

$$r(x) = \sum_{i=0}^{n-1} \sum_{j=0}^{m_i-1} \sum_{k=0}^{m_i-j-1} a_{ij} \frac{1}{j!} \frac{1}{k!} \left[ \frac{(x - \lambda_i)^{m_i}}{\Omega(x)} \right]_{x=x_i}^{(k)} \\ \times \frac{\Omega(x)}{(x - \lambda_i)^{m_i-j-k}},$$

where

$$\Omega(x) = \prod_{i=0}^{n-1} (x - \lambda_i)^{m_i},$$

and  $r^{(k)}(a)$  is the  $k$ -th derivative of  $r$  at  $a$ .

The applications of Hermite interpolation to numerical analysis are well known. A number of forms of the interpolating polynomial  $r(x)$  have been reported in the literature, which require calculation of derivatives of rational polynomial functions (e.g., [1]), or recursive calculation of the coefficients  $a_{ij}$  of Theorem 1.1 (e.g., [8]). We propose a closed form expression of the interpolating polynomial  $r$  of the univariate Hermite interpolation which is a variation of the classical Lagrange–Sylvester formula, as presented in [11]. The expression in [11] involves less computational load than the proposed Hermite interpolating polynomial except in the special case of very small values of  $m_j$ .

We utilise the Hermite interpolating polynomial to show the main result of this work, the parallel polynomial division by a separable polynomial.

Let us note that the remainder  $r \in \mathbb{K}[x]$  of the Euclidean division of any polynomial  $P \in \mathbb{K}[x]$  of degree  $n$  by a separable polynomial  $Q \in \mathbb{K}[x]$  of degree  $m$ , where  $n \geq m$ , can be calculated in closed form using the Lagrange interpolation formula as following:

$$r(x) = \sum_{i=1}^m P(\lambda_i) \prod_{j=1, j \neq i}^m \frac{(x - \lambda_j)}{(\lambda_i - \lambda_j)},$$

where  $\lambda_1, \dots, \lambda_m$  are the roots of  $Q$  in the algebraic closure  $\overline{\mathbb{K}}$  of  $\mathbb{K}$ . In this work, we extend this simplified idea of polynomial remainder calculation by Lagrange interpolation, to achieve a polynomial division by a common separable divisor, using the proposed closed form of the interpolating polynomial  $r$  of the univariate Hermite interpolation, although any expression of  $r$  may be utilized.

Furthermore, the above results will be used to obtain a number of new identities involving polynomial derivatives, as well as a closed form expression of the semisimple part of the Jordan decomposition of an algebraic element in an arbitrary algebra. These results however are independent from the selected expression of the Hermite interpolating polynomial.

The rest of the paper is organized as follows. In Section 2, we present a new closed form for Hermite interpolation. In Section 3, we present a new parallel division of polynomials by a common separable divisor over a perfect field, by expressing the remainders as derivatives of a unique polynomial. In Section 4, the main result

of Section 3 is applied to obtain a number of new identities involving polynomial derivatives, as well as a new closed form expression of the semisimple part of the Jordan decomposition of an algebraic element in an arbitrary algebra.

**2. A new closed form for Hermite interpolation.** Let  $\lambda_0, \lambda_1, \dots, \lambda_{n-1}$  be distinct elements in a perfect field  $\mathbb{K}$  and  $m_0, m_1, \dots, m_{n-1}$  be positive integers. Let us denote by  $L_k$  the polynomials given by

$$L_k(x) = \prod_{\substack{i=0 \\ i \neq k}}^{n-1} \frac{(x - \lambda_i)^{m_i}}{(\lambda_k - \lambda_i)^{m_i}} \in \mathbb{K}[x]. \quad (2.1)$$

Furthermore, we denote by  $\Lambda_k, 0 \leq k \leq n-1$ , the  $m_k \times m_k$  lower triangular matrices  $[l_{ij}] \in \mathbb{K}^{m_k \times m_k}, 0 \leq i, j \leq m_k - 1$ , given by

$$l_{ij} := \begin{cases} \binom{i}{j} (L_k)^{(i-j)}(\lambda_k) & \text{if } 0 \leq j \leq i \leq m_k - 1 \\ 0 & \text{if } 0 \leq i < j \leq m_k - 1 \end{cases},$$

where  $(L_k)^{(i-j)}(\lambda_k)$  is the derivative of order  $(i-j)$  of the polynomial  $L_k(x)$  at  $\lambda_k$ . Thus,  $\Lambda_k$  has the following representation

$$\begin{bmatrix} \binom{0}{0} L_k(\lambda_k) & 0 & \cdots & 0 \\ \binom{1}{0} (L_k)^{(1)}(\lambda_k) & \binom{1}{1} L_k(\lambda_k) & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ \binom{m_k-1}{0} (L_k)^{(m_k-1)}(\lambda_k) & \binom{m_k-1}{1} (L_k)^{(m_k-2)}(\lambda_k) & \cdots & \binom{m_k-1}{m_k-1} L_k(\lambda_k) \end{bmatrix}. \quad (2.2)$$

For our purpose the following technical lemmas are required:

**LEMMA 2.1.** *The matrices  $\Lambda_k, 0 \leq k \leq n-1$ , are invertible with  $\Lambda_k^{-1} = \sum_{i=0}^{m_k-1} (I_{m_k} - \Lambda_k)^i$ , where  $I_{m_k}$  is the  $m_k \times m_k$  unit matrix.*

*Proof.* Clearly, for  $0 \leq k \leq n-1$  holds  $L_k(\lambda_k) = 1$ . Therefore, all matrices  $\Lambda_k, 0 \leq k \leq n-1$  are invertible and lower unitriangular. Thus,  $(I_{m_k} - \Lambda_k)^{m_k} = 0$  and consequently  $\Lambda_k \sum_{i=0}^{m_k-1} (I_{m_k} - \Lambda_k)^i = I_{m_k}$ .  $\square$

Using Leibnitz's rule for derivatives, we easily get the following lemma:

**LEMMA 2.2.** *For  $0 \leq i, s \leq m_k - 1$  and  $0 \leq j, t \leq n-1$ , the following holds:*

$$\left( \frac{(x - \lambda_t)^s}{s!} L_t(x) \right)^{(i)} \Big|_{x=\lambda_j} = \begin{cases} 0 & \text{if } t \neq j \\ 0 & \text{if } t = j \text{ and } i < s \\ \binom{i}{s} (L_j)^{(i-s)}(\lambda_j) & \text{if } t = j \text{ and } s \leq i \end{cases}. \quad (2.3)$$

Our proposed form of Hermite interpolation can now be presented in the following theorem.

**THEOREM 2.3.** *Given  $n$  distinct elements  $\lambda_0, \lambda_1, \dots, \lambda_{n-1}$  in a perfect field  $\mathbb{K}$ , positive integers  $m_i, i = 0, \dots, n-1$ , and  $a_{ij} \in \mathbb{K}$  for  $0 \leq j \leq n-1, 0 \leq i \leq m_j-1$ . Then there exists one and only one polynomial  $r \in \mathbb{K}[x]$  of degree less than  $\sum_{i=0}^{n-1} m_i$ , such that*

$$r^{(i)}(\lambda_j) = a_{ij}, \quad 0 \leq j \leq n-1, 0 \leq i \leq m_j-1. \quad (2.4)$$

This polynomial  $r$  is explicitly given by,

$$\begin{aligned} r &= \sum_{j=0}^{n-1} X_j \Lambda_j^{-1} A_j \\ &= \sum_{j=0}^{n-1} \sum_{k=0}^{m_j-1} X_j (I_{m_j} - \Lambda_j)^k A_j, \end{aligned} \quad (2.5)$$

where the matrices  $X_j$  and  $A_j$  are given by

$$X_j = \left[ L_j(x) \quad \frac{(x-\lambda_j)}{1!} L_j(x) \quad \cdots \quad \frac{(x-\lambda_j)^{m_j-1}}{(m_j-1)!} L_j(x) \right],$$

and

$$A_j = \left[ a_{0j} \quad a_{1j} \quad \cdots \quad a_{m_j-1j} \right]^T.$$

*Proof.* It can be observed that (2.5) can be equivalently written in the following form:

$$r(x) = \sum_{j=0}^{n-1} \sum_{i=0}^{m_j-1} c_{ij} \frac{(x-\lambda_j)^i}{i!} L_j(x) \in \mathbb{K}[x],$$

where

$$\begin{bmatrix} c_{0j} \\ c_{1j} \\ \vdots \\ c_{m_j-1j} \end{bmatrix} = \Lambda_j^{-1} \begin{bmatrix} a_{0j} \\ a_{1j} \\ \vdots \\ a_{m_j-1j} \end{bmatrix}, \quad 0 \leq j \leq n-1. \quad (2.6)$$

Now, by calculating the derivative of order  $i$  of the polynomial  $r$  at  $\lambda_j$  and using (2.3) in Lemma 2.2, we obtain

$$r^{(i)}(\lambda_j) = \sum_{k=0}^i c_{kj} \binom{i}{k} (L_j)^{(i-k)}(\lambda_j), \quad (2.7)$$

for all  $0 \leq j \leq n - 1$ ,  $0 \leq i \leq m - 1$ . Taking into consideration the definition of  $\Lambda_j$  in (2.2), the system of equations (2.7) can be rewritten in the following matrix form

$$\begin{bmatrix} r(\lambda_j) \\ r'(\lambda_j) \\ \vdots \\ r^{(m_j-1)}(\lambda_j) \end{bmatrix} = \Lambda_j \begin{bmatrix} c_{0j} \\ c_{1j} \\ \vdots \\ c_{m_j-1j} \end{bmatrix}, \quad 0 \leq j \leq n - 1. \quad (2.8)$$

By substituting (2.6) in (2.8), we get

$$\begin{bmatrix} r(\lambda_j) \\ r'(\lambda_j) \\ \vdots \\ r^{(m_j-1)}(\lambda_j) \end{bmatrix} = \begin{bmatrix} a_{0j} \\ a_{1j} \\ \vdots \\ a_{m_j-1j} \end{bmatrix}.$$

Hence, we derive that  $r^{(i)}(\lambda_j) = a_{ij}$ ,  $0 \leq j \leq n - 1$ ,  $0 \leq i \leq m_j - 1$ . The second equality of (2.5) is obtained by Lemma 2.1.

Moreover, it can be easily confirmed that any polynomial  $(x - \lambda_j)^i L_j(x)$ ,  $0 \leq j \leq n - 1$ ,  $0 \leq i \leq m_j - 1$  has degree less than  $\sum_{i=0}^{n-1} m_i$ , and since  $r$  is a  $\mathbb{K}$ -linear combination of these polynomials, we conclude that the degree of  $r$  is less than  $\sum_{i=0}^{n-1} m_i$ .  $\square$

REMARK 2.4. The inversion of matrices  $\Lambda_j$  in Theorem 2.3 may be performed by any efficient numerical technique, replacing the last expression in (2.1).

**3. Division of polynomials by a separable polynomial.** At this point we are ready to present the following generalization of Euclidean polynomial division by a separable divisor, based on Theorem 2.3.

THEOREM 3.1. *Let  $g \in \mathbb{K}[x]$  be a separable polynomial and  $\lambda_0, \dots, \lambda_{n-1}$  be the roots of  $g$  in the algebraic closure  $\overline{\mathbb{K}}$  of  $\mathbb{K}$ . Then for any polynomials  $f_0, f_1, \dots, f_{m-1} \in \mathbb{K}[x]$ , there exists unique  $r \in \mathbb{K}[x]$  of degree less than  $mn$  and unique polynomials  $q_0, q_1, \dots, q_{m-1} \in \mathbb{K}[x]$  such that*

$$f_i = r^{(i)} + gq_i, \quad 0 \leq i \leq m - 1.$$

*This result is optimal, in the sense that if  $m \geq 1$  and  $g$  is inseparable, then this result is not true. The polynomial  $r$  is given by*

$$r(x) = \sum_{j=0}^{n-1} X_j \Lambda_j^{-1} A_j \in \mathbb{K}[x],$$

where

$$X_j = \left[ L_j(x) \quad \frac{(x-\lambda_j)}{1!}L_j(x) \quad \cdots \quad \frac{(x-\lambda_j)^{m-1}}{(m-1)!}L_j(x) \right],$$

$$A_j = \left[ f_0(\lambda_j) \quad f_1(\lambda_j) \quad \cdots \quad f_{m-1}(\lambda_j) \right]^T$$

and  $L_j, \Lambda_j$  are respectively as in (2.1), (2.2) by  $m_0 = m_1 = \cdots = m_{n-1} = m$ .

*Proof.* Let  $k$  be the dimension of the field  $\mathbb{K}(\lambda_0, \dots, \lambda_{n-1})$  as vector space over  $\mathbb{K}$ , that is,

$$k = [\mathbb{K}(\lambda_0, \dots, \lambda_{n-1}), \mathbb{K}]. \quad (3.1)$$

Then there exist  $\tau_1, \dots, \tau_{k-1}$  in  $\mathbb{K}(\lambda_0, \dots, \lambda_{n-1})$  such that  $\{1, \tau_1, \dots, \tau_{k-1}\}$  is a basis of  $\mathbb{K}(\lambda_0, \dots, \lambda_{n-1})$  as a vector space over  $\mathbb{K}$ .

Now, using Theorem 2.3 by  $m_0 = m_1 = \cdots = m_{n-1} = m$ , we have that there is unique polynomial  $\hat{r} \in \mathbb{K}(\lambda_0, \dots, \lambda_{n-1})[x]$  given by (2.5) for  $m_0 = m_1 = \cdots = m_{n-1} = m$  having degree less than  $mn$  such that

$$(\hat{r})^{(i)}(\lambda_j) = f_i(\lambda_j), \quad (3.2)$$

for all  $0 \leq i \leq m-1, 0 \leq j \leq n-1$ . Therefore, there exist polynomials  $\hat{q}_i \in \mathbb{K}(\lambda_0, \dots, \lambda_{n-1})[x], 0 \leq i \leq m-1$ , such that

$$\hat{r}^{(i)} = f_i + g\hat{q}_i. \quad (3.3)$$

Moreover, by (3.1) we have that the dimension of  $\mathbb{K}(\lambda_0, \dots, \lambda_{n-1})[x]$  as free module over  $\mathbb{K}[x]$  is  $k$  and  $\{1, \tau_1, \dots, \tau_{k-1}\}$  is a basis of  $\mathbb{K}(\lambda_0, \dots, \lambda_{n-1})[x]$  over  $\mathbb{K}[x]$ . Therefore, the polynomials  $\hat{r}, \hat{q}_i \in \mathbb{K}(\lambda_0, \dots, \lambda_{n-1})[x]$  can be uniquely written in the following form:

$$\hat{r} = r + \sum_{s=1}^{n-1} \tau_s r_s, \quad (3.4)$$

and

$$\hat{q}_i = q_i + \sum_{s=1}^{n-1} \tau_s q_{si}, \quad 0 \leq i \leq m-1, \quad (3.5)$$

where  $r, r_s, q_i, q_{si} \in \mathbb{K}[x]$ , with  $\deg r, \deg r_i < mn$ .

Setting (3.4) and (3.5) in (3.3), we get

$$r^{(i)} = f_i + gq_i \quad (3.6)$$

for all  $0 \leq i \leq m-1$ .

Now from (3.6) we clearly get that  $r$  satisfies the identities (3.2), and since the polynomial of degree less than  $mn$  satisfying the identities (3.2) is unique, we conclude that  $r = \widehat{r}$ .

Finally, suppose that Theorem 3.1 is true for one polynomial  $g \in \mathbb{K}[x]$  having a root  $\lambda \in \overline{\mathbb{K}}$  of multiplicity  $> 1$ . Then there exists a polynomial  $g_0$  in  $\overline{\mathbb{K}}[x]$  such that

$$g(x) = (x - \lambda)^2 g_0(x).$$

Applying Theorem 3.1 for  $g$  and  $f_0 = f_1 = 1$ , we obtain

$$r(x) = 1 + (x - \lambda)^2 g_0(x) q_0(x) \tag{3.7}$$

and

$$r^{(1)}(x) = 1 + (x - \lambda)^2 g_0(x) q_1(x) \tag{3.8}$$

for some  $r, q_0, q_1 \in \overline{\mathbb{K}}[x]$ .

Differentiating (3.7), and setting  $x = \lambda$  in the resulting identity, as well as in (3.8), we respectively get the contradiction

$$r^{(1)}(\lambda) = 0 \text{ and } r^{(1)}(\lambda) = 1. \quad \square$$

**4. Applications of Theorem 3.1.** Firstly, we will use Theorem 3.1 to give a closed formula for the semi-simple part of the well known Jordan decomposition, (e.g., [2, 4, 7]) of an algebraic element  $A$  of an algebra  $\mathbf{A}$  over a perfect field  $\mathbb{K}$  into a semisimple  $S_A$  and a nilpotent part. A proof of the existence of  $S_A$  that is presented in the book of Hoffman and Kunze [4], is based on Newton's method and yields direct methods for computations. An algorithm, which is essentially based on these ideas, is given by Levelt [6]. The algorithm of Bourgoyne and Cushman [3] is faster, because higher derivatives are used. In [9], D. Schmidt has used Newton's method to construct the semi-simple part of the Jordan decomposition of an algebraic element in an arbitrary algebra, showing quadratic convergence of the algorithm. Another approach uses the partial fractions decomposition of the reciprocal of the minimal polynomial [5, 10, 11]. An explicit construction of the spectral decomposition of a matrix using Hermite interpolation is reported in [11], which requires the use of Taylor coefficients of the reciprocal of the matrix minimal polynomial.

In this work, we also obtain a new closed formula for the semi-simple part  $S_A$  of the Jordan decomposition of an algebraic element  $A$  in an arbitrary algebra, using our proposed polynomial division by a common separable divisor. The proposed closed formula requires only evaluation of the derivatives of the basic Hermite-like interpolation polynomials that are associated with the eigenvalues of  $A$ , up to the

maximum algebraic multiplicity of the roots of the minimal polynomial of  $A$ , as well as matrix multiplication operations. It has to be noted however that the semi-simple part  $S_A$  of  $A$  is obtained using a polynomial of higher degree than the one used in [11]. In order to obtain the expression for  $S_A$  we need the following lemma.

LEMMA 4.1. *Let  $g \in \mathbb{K}[x]$  be a separable polynomial and  $\lambda_0, \dots, \lambda_{n-1}$  are the roots of  $g$  in  $\overline{\mathbb{K}}$ . Let  $f \in \mathbb{K}[x, y]$  be a polynomial of two variables and  $m$  be a positive integer. Then there exists unique  $r \in \mathbb{K}[x]$  of degree less than  $mn$  such that*

$$f(x, y) = r(x + y) \pmod{I},$$

where  $I \subset \mathbb{K}[x, y]$  is the ideal generated from the polynomials  $g(x), y^m$ . Further, the polynomial  $r$  is given by

$$r(x) = \sum_{j=0}^{n-1} X_j \Lambda_j^{-1} A_j \in \mathbb{K}[x], \quad (4.1)$$

where the matrices  $X_j, A_j$  are given by

$$X_j = \begin{bmatrix} L_j(x) & \frac{(x-\lambda_j)}{1!} L_j(x) & \cdots & \frac{(x-\lambda_j)^{m-1}}{(m-1)!} L_j(x) \end{bmatrix},$$

$$A_j = \begin{bmatrix} f(\lambda_j, 0) & \frac{\partial}{\partial y} f(\lambda_j, 0) & \cdots & \frac{\partial^{m-1}}{\partial y^{m-1}} f(\lambda_j, 0) \end{bmatrix}^T,$$

and  $L_j, \Lambda_j$  are as in (2.1), (2.2) by  $m_0 = m_1 = \dots = m_{n-1} = m$

*Proof.* The polynomial  $f$  can be rewritten in the form

$$f(x, y) = \sum_{i=0}^{m-1} \frac{1}{i!} \frac{\partial^i}{\partial y^i} f(x, 0) y^i + y^m h(x, y), \quad (4.2)$$

for some  $h \in \mathbb{K}[x, y]$ .

Furthermore, according to Theorem 3.1 there exists unique polynomial  $r \in \mathbb{K}[x]$  of degree less than  $mn$ , given by (4.1), such that:

$$\frac{\partial^i}{\partial y^i} f(x, 0) = r^{(i)}(x) \pmod{g(x)}, \quad 0 \leq i \leq m-1, \quad (4.3)$$

Combining (4.2) with (4.3), we get

$$f(x, y) = \sum_{i=0}^{m-1} \frac{r^{(i)}(x)}{i!} y^i \pmod{I}. \quad (4.4)$$

Furthermore, by using the Taylor formula, we have:

$$\sum_{i=0}^{m-1} \frac{r^{(i)}(x)}{i!} y^i = r(x + y) \pmod{y^m}. \quad (4.5)$$

Substituting (4.5) in (4.4) completes the proof.  $\square$

Now we will use Theorem 3.1 to give a closed formula for the semi-simple part of the Jordan decomposition of an algebraic number of an algebra  $\mathbf{A}$  over a perfect field  $\mathbb{K}$ .

Let  $p \in \mathbb{K}[x]$  be the minimal polynomial of an algebraic element  $A$  of an algebra  $\mathbf{A}$  over  $\mathbb{K}$  with unit 1. Let  $\lambda_i, i = 0, 1, \dots, n-1$  be the distinct roots of  $p$  in  $\overline{\mathbb{K}}$ , and let  $k_i, i = 1, 2, \dots, n-1$  be their respective multiplicities. We denote  $\widehat{p}(x) := \prod_{i=0}^{n-1} (x - \lambda_i)$  and  $m(p) := \max \{k_0, \dots, k_{n-1}\}$ .

PROPOSITION 4.2. *The semi-simple part  $S_A$  of the Jordan decomposition of  $A$  is given by  $S_A = r(A)$ , where  $r(x)$  is the polynomial*

$$r(x) = \sum_{j=0}^{n-1} X_j \Lambda_j^{-1} A_j \in \mathbb{K}[x], \quad (4.6)$$

where

$$X_j = \left[ L_j(x) \quad \frac{(x-\lambda_j)}{1!} L_j(x) \quad \dots \quad \frac{(x-\lambda_j)^{m-1}}{(m-1)!} L_j(x) \right],$$

$$A_j = \left[ \lambda_j \quad 0 \quad \dots \quad 0 \right]^T,$$

and  $L_j, \Lambda_j$  are as in (2.1), (2.2) by  $m_0 = m_1 = \dots = m_{n-1} = m(p)$ .

*Proof.* Since  $S_A$  is the semi-simple part of  $A$  and  $N_A$  is the nilpotent part of  $A$ , the minimal polynomials of  $S_A$  and  $N_A$  are respectively  $\widehat{p}(x)$  and  $x^{m(p)}$ . So we have  $\widehat{p}(S_A) = 0$  and  $N_A^{m(p)} = 0$ . Now if we apply Lemma 4.1 by choosing  $f(x, y) = x$ ,  $g(x) = \widehat{p}(x)$  and  $m = m(p)$ , and taking into account that  $f(x, 0) = x$ , and  $\frac{\partial^i}{\partial y^i} f(x, 0) = 0$  for  $1 \leq i \leq m-1$  we have that for the polynomial  $r$  given by (4.6) holds:

$$x = r(x + y) \pmod{I}, \quad (4.7)$$

where  $I$  is the ideal generated from the polynomials  $\widehat{p}(x)$  and  $y^{m(p)}$ . Finally setting  $x = S_A$  and  $y = N_A$  in (4.7) we get  $S_A = r(S_A + N_A) = r(A)$ .  $\square$

The next result of this section is the generalization of Theorem 3.1, which is expressed in the following theorem.

THEOREM 4.3. *Let  $g \in \mathbb{K}[x]$  be separable of degree  $n$ . Let  $\Pi \in (\mathbb{K}[x])^{m \times m}$  such that  $\det(\Pi) \neq 0$ . Then, for any polynomials  $f_0, f_1, \dots, f_{m-1} \in \mathbb{K}[x]$ , there exists a unique polynomial  $r \in \mathbb{K}[x]$  of degree less than  $mn$ , such that*

$$\Pi \begin{bmatrix} r \\ r' \\ \vdots \\ r^{(m-1)} \end{bmatrix} = E \begin{bmatrix} f_0 \\ f_1 \\ \vdots \\ f_{m-1} \end{bmatrix} \pmod{g},$$

where  $E := \gcd(g, \det(\Pi))$ .

*Proof.* We start from

$$\Pi\tilde{\Pi} = \tilde{\Pi}\Pi = \det(\Pi)I_m, \quad (4.8)$$

where  $\tilde{\Pi}$  is the adjugate of  $\Pi$  and  $I_m$  is the  $m \times m$  unit matrix.

Moreover, since  $E = \gcd(g, \det(\Pi))$  one has that there exist  $H, G \in \mathbb{K}[x]$  such that

$$H \det(\Pi) + Gg = E. \quad (4.9)$$

Combining (4.8) with (4.9), we get

$$H\Pi\tilde{\Pi} = (E - gG)I_m. \quad (4.10)$$

Now, according to Theorem 3.1, there exists a unique  $r \in \mathbb{K}[x]$  of degree less than  $mn$  such that

$$\begin{bmatrix} r \\ r' \\ \vdots \\ r^{(m-1)} \end{bmatrix} = H\tilde{\Pi} \begin{bmatrix} f_0 \\ f_1 \\ \vdots \\ f_{m-1} \end{bmatrix} \pmod{g}. \quad (4.11)$$

Multiplying (4.11) from the left by  $\Pi$  and setting (4.10) in the resulting identity we get the conclusion.  $\square$

REMARK 4.4. Choosing  $\Pi = I_m$  in Theorem 4.3, we get Theorem 3.1. Therefore, Theorem 4.3 can be regarded as a generalization of Theorem 3.1.

Now we will apply Theorem 4.3 to produce some formulas for polynomials involving derivatives.

COROLLARY 4.5. *Let  $g, g_0, g_1, \dots, g_{m-1} \in \mathbb{K}[x]$  be polynomials. Assume that  $g$  is separable and that*

$$(g_i, g) = 1, \quad 0 \leq i \leq m-1.$$

*Then, for any  $f_0, f_1, \dots, f_{m-1} \in \mathbb{K}[x]$ , there exists unique  $r \in \mathbb{K}[x]$  of degree less than  $mn$  such that*

$$g_i r^{(i)} = f_i \pmod{g}, \quad 0 \leq i \leq m-1.$$

*Proof.* Applying Theorem 4.3 by

$$\Pi := \begin{bmatrix} g_0 & 0 & \cdots & 0 \\ 0 & g_1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \cdots & 0 & g_{m-1} \end{bmatrix},$$

and afterwards using that  $E = \gcd(g, \det(\Pi)) = \prod_{i=0}^{m-1} g_i = 1$ , we directly get the conclusion.  $\square$

COROLLARY 4.6. *Let  $g, g_0, g_1, \dots, g_{m-1} \in \mathbb{K}[x]$  be as in Corollary 4.5. Then, for any  $f_0, f_1, \dots, f_{m-1} \in \mathbb{K}[x]$ , there exists unique  $r$  of degree less than  $mn$  such that*

$$(g_i r)^{(i)} = f_i \pmod{g}, \quad 0 \leq i \leq m-1.$$

*Proof.* Let  $\Pi \in (\mathbb{K}[x])^{m \times m}$  be the matrix defined by

$$\Pi = \begin{bmatrix} g_0 & 0 & \cdots & 0 \\ \binom{1}{0} g_1^{(1)} & \binom{1}{1} g_1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ \binom{m-1}{0} g_{m-1}^{(m-1)} & \binom{m-1}{1} g_{m-1}^{(m-2)} & \cdots & \binom{m-1}{m-1} g_{m-1}^{(0)} \end{bmatrix}. \quad (4.12)$$

From the assumptions

$$(g_i, g) = 1, \quad 0 \leq i \leq m-1,$$

we have

$$(\det(\Pi), g) = 1. \quad (4.13)$$

Applying Theorem 4.3 for  $\Pi$ , as given in (4.12), using (4.13) and Leibnitz's rule, we get the conclusion.  $\square$
