A Diaz–Metcalf Type Inequality for Positive Linear Maps and Its Applications

MOHAMMAD SAL MOSLEHIAN1, RITSUO NAKAMOTO2, AND YUKI SEO3

Abstract. We present a Diaz–Metcalf type operator inequality as a reverse Cauchy–Schwarz inequality and then apply it to get some operator versions of Pólya–Szegö’s, Greub–Rheinboldt’s, Kantorovich’s, Shisha–Mond’s, Schweitzer’s, Cassels’ and Klamkin–McLenaghan’s inequalities via a unified approach. We also give some operator Grüss type inequalities and an operator Ozeki–Izumino–Mori–Seo type inequality. Several applications are included as well.

Key words. Diaz–Metcalf type inequality, Reverse Cauchy–Schwarz inequality, Positive map, Ozeki–Izumino–Mori–Seo inequality, Operator inequality.

AMS subject classifications. 46L08, 26D15, 46L05, 47A30, 47A63.

1. Introduction. The Cauchy–Schwarz inequality plays an essential role in mathematical analysis and its applications. In a semi-inner product space \((\mathcal{H}, \langle \cdot, \cdot \rangle)\) the Cauchy–Schwarz inequality reads as follows

\[ |\langle x, y \rangle| \leq \langle x, x \rangle^{1/2} \langle y, y \rangle^{1/2} \quad (x, y \in \mathcal{H}). \]

There are interesting generalizations of the Cauchy–Schwarz inequality in various frameworks, e.g., finite sums, integrals, isotone functionals, inner product spaces, \(C^*\)-algebras and Hilbert \(C^*\)-modules; see [5, 6, 7, 9, 11, 13, 17, 20] and references therein. There are several reverses of the Cauchy–Schwarz inequality in the literature: Diaz–Metcalf’s, Pólya–Szegö’s, Greub–Rheinboldt’s, Kantorovich’s, Shisha–Mond’s, Ozeki–Izumino–Mori–Seo’s, Schweitzer’s, Cassels’ and Klamkin–McLenaghan’s inequalities.

Inspired by the work of J.B. Diaz and F.T. Metcalf [4], we present several reverse Cauchy–Schwarz type inequalities for positive linear maps. We give a unified treatment of some reverse inequalities of the classical Cauchy–Schwarz type for positive

linear maps.

Throughout the paper $\mathbb{B}(\mathcal{H})$ stands for the algebra of all bounded linear operators acting on a Hilbert space $\mathcal{H}$. We simply denote by $\alpha$ the scalar multiple $\alpha I$ of the identity operator $I \in \mathbb{B}(\mathcal{H})$. For self-adjoint operators $A, B$ the partially ordered relation $B \leq A$ means that $\langle B\xi, \xi \rangle \leq \langle A\xi, \xi \rangle$ for all $\xi \in \mathcal{H}$. In particular, if $0 \leq A$, then $A$ is called positive. If $A$ is a positive invertible operator, then we write $0 < A$. A linear map $\Phi : \mathcal{A} \rightarrow \mathcal{B}$ between $C^*$-algebras is said to be positive if $\Phi(A)$ is positive whenever $A$ is. We say that $\Phi$ is unital if $\Phi$ preserves the identity. The reader is referred to [9, 19] for undefined notations and terminologies.

2. Operator Diaz–Metcalf type inequality. We start this section with our main result. Recall that the geometric operator mean $A \# B$ for positive operators $A, B \in \mathbb{B}(\mathcal{H})$ is defined by

$$A \# B = A^{\frac{1}{2}} (A^{-\frac{1}{2}}BA^{-\frac{1}{2}})^{\frac{1}{2}} A^{\frac{1}{2}}$$

if $0 < A$.

**Theorem 2.1.** Let $A, B \in \mathbb{B}(\mathcal{H})$ be positive invertible operators and $\Phi : \mathbb{B}(\mathcal{H}) \rightarrow \mathbb{B}(\mathcal{H})$ be a positive linear map.

(i) If $m^2 A \leq B \leq M^2 A$ for some positive real numbers $m < M$, then the following inequalities hold:

- **Operator Diaz–Metcalf inequality of first type**
  
  $$Mm\Phi(A) + \Phi(B) \leq (M + m)\Phi(A \# B);$$

- **Operator Cussells inequality**
  
  $$\Phi(A) \# \Phi(B) \leq \frac{M + m}{2\sqrt{Mm}} \Phi(A \# B);$$

- **Operator Klamkin–McLenaghan inequality**
  
  $$\Phi(A \# B)^{1/2} - \Phi(B)\Phi(A \# B)^{1/2} - \Phi(A \# B)^{-1/2} \Phi(A)^{-1} \Phi(A \# B)^{1/2} \leq (\sqrt{M} - \sqrt{m})^2;$$

- **Operator Kantorovich inequality**
  
  $$\Phi(A) \# \Phi(A^{-1}) \leq \frac{M^2 + m^2}{2Mm}.$$ 

(ii) If $m_1^2 \leq A \leq M_1^2$ and $m_2^2 \leq B \leq M_2^2$ for some positive real numbers $m_1 < M_1$ and $m_2 < M_2$, then the following inequalities hold:
A Diaz–Metcalf Type Inequality for Positive Linear Maps

- **Operator Diaz–Metcalf inequality of second type**
  \[
  \frac{M_2 m_2}{M_1 m_1} \Phi(A) + \Phi(B) \leq \left( \frac{M_2}{m_1} + \frac{m_2}{M_1} \right) \Phi(A^*_2 B);
  \]

- **Operator Pólya–Szegö inequality**
  \[
  \Phi(A) \Phi(B) \leq \frac{1}{2} \left( \sqrt{\frac{M_1 M_2}{m_1 m_2}} + \sqrt{\frac{m_1 m_2}{M_1 M_2}} \right) \Phi(A^*_2 B);
  \]

- **Operator Shisha–Mond inequality**
  \[
  \Phi(A^*_2 B) + \Phi(A) \Phi(B) \leq \Phi(A^*_2 B) + \Phi(A) \Phi(B) - \Phi(A^*_2 B)^\frac{1}{2} \Phi(A)^{\frac{1}{2}} \Phi(B)^{\frac{1}{2}}
  \leq \left( \sqrt{\frac{M_2}{m_1}} - \sqrt{\frac{m_2}{M_1}} \right)^2;
  \]

- **Operator Grüss type inequality**
  \[
  \Phi(A^*_2 B) - \Phi(A) \Phi(B) \leq \sqrt{M_1 M_2} \left( \sqrt{\frac{M_1 M_2}{m_1 m_2}} - \sqrt{\frac{m_1 m_2}{M_1 M_2}} \right)^2 \min \left\{ \frac{M_1}{m_1}, \frac{M_2}{m_2} \right\}.
  \]

**Proof.**

(i) If \(m^2 A \leq B \leq M^2 A\) for some positive real numbers \(m < M\), then
\[
m^2 \leq A^\frac{1}{2} BA^\frac{1}{2} \leq M^2.
\]

(ii) If \(m_1^2 \leq A \leq M_1^2\) and \(m_2^2 \leq B \leq M_2^2\) for some positive real numbers \(m_1 < M_1\) and \(m_2 < M_2\), then
\[
m^2 = \frac{m_2^2}{M_1^2} \leq A^\frac{1}{2} BA^\frac{1}{2} \leq \frac{M_2^2}{m_1^2} = M^2.
\]

In any case we then have
\[
\left( M - \left( A^\frac{1}{2} BA^\frac{1}{2} \right)^{1/2} \right) \left( A^\frac{1}{2} BA^\frac{1}{2} \right)^{1/2} \geq 0,
\]
whence
\[
Mm + A^\frac{1}{2} BA^\frac{1}{2} \leq (M + m) \left( A^\frac{1}{2} BA^\frac{1}{2} \right)^{1/2}.
\]
Hence
\[
MmA + B \leq (M + m) A^{1/2} \left( A^\frac{1}{2} BA^\frac{1}{2} \right)^{1/2} A^{1/2} = (M + m) A^*_2 B.
\]

Since \(\Phi\) is a positive linear map, (2.2) yields the **operator Diaz–Metcalf inequality of first type** as follows:
\[
Mm \Phi(A) + \Phi(B) \leq (M + m) \Phi(A^*_2 B).
\]
In the case when (ii) holds we get the following, which is called the operator Diaz–Metcalf inequality of second type:

$$\frac{M_2 m_2}{M_1 m_1} \Phi(A) + \Phi(B) \leq \left( \frac{M_2}{m_1} + \frac{m_2}{M_1} \right) \Phi(A\sharp B).$$

Following the strategy of [21], we apply the operator geometric–arithmetic inequality to $M m \Phi(A)$ and $\Phi(B)$ to get:

$$\sqrt{M m} \Phi(A\sharp B) = \left( \frac{M_2}{m_1} \Phi(A) \right)^{1/2} \left( \frac{m_2}{M_1} \Phi(B) \right)^{1/2} \leq \frac{1}{2} \left( M m \Phi(A) + \Phi(B) \right).$$

(2.4)

It follows from (2.3) and (2.4) that

$$\Phi(A\sharp B) \leq \frac{M + m}{2\sqrt{M m}} \Phi(A\sharp B),$$

which is said to be the operator Cassels inequality under the assumption (i); see also [16]. Under the case (ii) we can represent it as the following inequality being called the operator Pólya–Szegö inequality or the operator Greub–Rheinboldt inequality:

$$\Phi(A\sharp B) \leq \frac{1}{2} \left( \frac{M_1 M_2}{m_1 m_2} + \frac{m_1 m_2}{M_1 M_2} \right) \Phi(A\sharp B).$$

(2.5)

It follows from (2.5) that

$$\Phi(A\sharp B) - \Phi(A\sharp B) \leq \left( \frac{1}{2} \left( \frac{M_1 M_2}{m_1 m_2} + \frac{m_1 m_2}{M_1 M_2} \right) - 1 \right) \Phi(A\sharp B)$$

$$= \frac{\left( \sqrt{M_1 M_2} - \sqrt{m_1 m_2} \right)^2}{2\sqrt{m_1 m_2} \sqrt{M_1 M_2}} \Phi(A\sharp B).$$

(2.6)

It follows from (2.1) that

$$\frac{m_2}{M_1} A \leq \left( A^{1/2} B A^{-1/2} \right)^{1/2} \left( A^{1/2} \right) \leq \frac{M_2}{m_1} A,$$

so

$$\frac{m_1 m_2}{M_1} \leq A\sharp B \leq \frac{M_1 M_2}{m_1}.$$

(2.7)

Now, (2.6) and (2.7) yield that

$$\Phi(A\sharp B) - \Phi(A\sharp B) \leq \frac{\left( \sqrt{M_1 M_2} - \sqrt{m_1 m_2} \right)^2}{2\sqrt{m_1 m_2} \sqrt{M_1 M_2}} \frac{M_1 M_2}{m_1}.$$

An easy symmetric argument then follows that

$$\Phi(A\sharp B) - \Phi(A\sharp B) \leq \frac{\sqrt{M_1 M_2} \left( \sqrt{M_1 M_2} - \sqrt{m_1 m_2} \right)^2}{2\sqrt{m_1 m_2} \sqrt{M_1 M_2}} \min \left\{ \frac{M_1}{m_1}, \frac{M_2}{m_2} \right\}.$$
presenting a Grüss type inequality.

If $A$ is invertible and $\Phi$ is unital and $m_2^2 = m^2 \leq A \leq M^2 = M_2^2$, then by putting $m_2^2 = 1/M^2 \leq B = A^{-1} \leq 1/m^2 = M_2^2$ in (2.5) we get the following operator Kantorovich inequality:

$$\Phi(A)\Phi(A^{-1}) \leq \frac{M^2 + m^2}{2Mm}.$$  

It follows from (2.3) that

$$\Phi(A\#B)\Phi(B)\Phi(A\#B)\Phi(A)^{-1}\Phi(A\#B)^\frac{1}{2}$$

$$\leq M + m - Mm\Phi(A\#B)\Phi(A)\Phi(A\#B)\Phi(A)^{-1}\Phi(A\#B)^\frac{1}{2}$$

$$\leq M + m - 2\sqrt{M}m - \left(\sqrt{M}m\left(\Phi(A\#B)\Phi(A)\Phi(A\#B)\Phi(A)^{-1}\Phi(A\#B)^\frac{1}{2}\right)^{1/2}ight)^2$$

$$\leq (\sqrt{M} - \sqrt{m})^2,$$  

that is, an operator Klakmin–Mclenaghan inequality when (i) holds. Under (ii), we get the following operator Shisha–Szegö inequality from (2.8):

$$\Phi(A\#B)\Phi(B)\Phi(A\#B)\Phi(A)^{-1}\Phi(A\#B)^\frac{1}{2} \leq \left(\sqrt{\frac{M_2}{m_1}} - \sqrt{\frac{m_2}{M_1}}\right)^2.$$  

3. Applications. If $(a_1, \ldots, a_n)$ and $(b_1, \ldots, b_n)$ are $n$-tuples of real numbers with $0 < m_1 \leq a_i \leq M_1 (1 \leq i \leq n), 0 < m_2 \leq b_i \leq M_2 (1 \leq i \leq n)$, we can consider the positive linear map $\Phi(T) = \langle Tx, x \rangle$ on $B(C^n) = M_n(C)$ and let $A = \text{diag}(a_1^2, \ldots, a_n^2), B = \text{diag}(b_1^2, \ldots, b_n^2)$ and $x = (1, \ldots, 1)'$ in the operator inequalities above to get the following classical inequalities:

- **Diaz–Metcalf inequality** [4]

$$\sum_{k=1}^{n} b_k^2 + \frac{m_2M_2}{m_1M_1} \sum_{k=1}^{n} a_k^2 \leq \left(\frac{M_2}{m_1} + \frac{m_2}{M_1}\right) \sum_{k=1}^{n} a_kb_k.$$  

- **Pólya–Szegö inequality** [23]

$$\frac{\sum_{k=1}^{n} a_k^2}{(\sum_{k=1}^{n} a_k b_k)^2} \leq \frac{1}{4} \left(\sqrt{\frac{M_1M_2}{m_1m_2}} + \sqrt{\frac{m_1m_2}{M_1M_2}}\right)^2;$$  

- **Shisha–Mond inequality** [24]

$$\frac{\sum_{k=1}^{n} a_k^2}{\sum_{k=1}^{n} a_k b_k} - \sum_{k=1}^{n} \frac{a_kb_k}{b_k^2} \leq \left(\frac{M_1}{m_2} - \sqrt{\frac{m_1}{M_2}}\right)^2;$$
A Grüss type inequality
\[
\left( \sum_{k=1}^{n} a_k^2 \right)^{1/2} \left( \sum_{k=1}^{n} b_k^2 \right)^{1/2} - \sum_{k=1}^{n} a_k b_k \leq \sqrt{M_1 M_2} \left( \sqrt{M_1 M_2} - \sqrt{m_1 m_2} \right)^2 \min \left\{ \frac{M_1}{m_1}, \frac{M_2}{m_2} \right\}.
\]

Using the same argument with a positive \(n\)-tuple \((a_1, \ldots, a_n)\) of real numbers with \(0 < m \leq a_i \leq M \) \((1 \leq i \leq n)\), \(x = \frac{1}{\sqrt{n}} (1, \ldots, 1)^t\), we get from Kantorovich inequality that

- Schweitzer inequality \([2]\)
\[
\left( \frac{1}{n} \sum_{i=1}^{n} a_i^2 \right) \left( \frac{1}{n} \sum_{i=1}^{n} a_i^{-2} \right) \leq \frac{(M^2 + m^2)^2}{4M^2m^2}.
\]

Using the same argument, we obtain a weighted form of the Pólya–Szegő inequality as follows:

- Cassels inequality \([25]\)
\[
\sum_{k=1}^{n} w_k a_k^2 \sum_{k=1}^{n} w_k b_k^2 \left( \sum_{k=1}^{n} w_k a_k b_k \right)^2 \leq \frac{(M + m)^2}{4mM};
\]

- Klamkin–McLenagahan inequality \([14]\)
\[
\sum_{k=1}^{n} w_k a_k^2 \sum_{k=1}^{n} w_k b_k^2 - \left( \sum_{k=1}^{n} w_k a_k b_k \right)^2 \leq \left( \sqrt{M} - \sqrt{m} \right)^2 \sum_{k=1}^{n} w_k a_k b_k \sum_{k=1}^{n} w_k a_k^2.
\]

One can assert the integral versions of discrete results above by considering \(L^2(X, \mu)\), where \((X, \mu)\) is a probability space, as a Hilbert space via \(\langle h_1, h_2 \rangle = \int_X h_1 h_2 d\mu\), multiplication operators \(A, B \in B(L^2(X, \mu))\) defined by \(A(h) = f^2 h\)
A Diaz–Metcalf Type Inequality for Positive Linear Maps

and \( B(h) = g^2 h \) for bounded \( f, g \in L^2(X, \mu) \) and a positive linear map \( \Phi \) by \( \Phi(T) = \int_X T(1) \, d\mu \) on \( \mathcal{B}(L^2(X, \mu)) \). For instance, let us state integral versions of the Cassels and Klamkin–McLenaghan inequalities. These two inequalities are obtained, first for bounded positive functions \( f, g \in L^2(X, \mu) \) and next for general positive functions \( f, g \in L^2(X, \mu) \) as the limits of sequences of bounded positive functions.

**Corollary 3.1.** Let \((X, \mu)\) be a probability space and \( f, g \in L^2(X, \mu) \) with \( 0 \leq mg \leq f \leq M g \) for some scalars \( 0 < m < M \). Then

\[
\int_X f^2 \, d\mu \int_X g^2 \, d\mu \leq \left( \frac{M + m}{4Mm} \right) \left( \int_X fg \, d\mu \right)^2
\]

and

\[
\int_X f^2 \, d\mu \int_X g^2 \, d\mu - \left( \int_X fg \, d\mu \right)^2 \leq \left( \sqrt{M} - \sqrt{m} \right)^2 \int_X fg \, d\mu \int_X f^2 \, d\mu .
\]

Considering the positive linear functional \( \Phi(R) = \sum_{i=1}^n \langle R \xi_i, \xi_i \rangle \) on \( \mathcal{B}(\mathcal{H}) \), where \( \xi_1, \ldots, \xi_n \in \mathcal{H} \), we get the following versions of the Diaz–Metcalf and Pólya–Szegö inequalities in a Hilbert space.

**Corollary 3.2.** Let \( \mathcal{H} \) be a Hilbert space, let \( \xi_1, \ldots, \xi_n \in \mathcal{H} \) and let \( T, S \in \mathcal{B}(\mathcal{H}) \) be positive operators satisfying \( 0 < m_1 \leq T \leq M_1 \) and \( 0 < m_2 \leq S \leq M_2 \). Then

\[
\frac{M_2 m_2}{M_1 m_1} \sum_{i=1}^n \|T \xi_i\|^2 + \sum_{i=1}^n \|S \xi_i\|^2 \leq \left( \frac{M_2}{m_1} + \frac{m_2}{M_1} \right) \sum_{i=1}^n \|(T^2 S^2)^{1/2} \xi_i\|^2
\]

and

\[
\left( \sum_{i=1}^n \|T \xi_i\|^2 \right)^{1/2} \left( \sum_{i=1}^n \|S \xi_i\|^2 \right)^{1/2} \leq \frac{1}{2} \left( \sqrt{\frac{M_1 M_2}{m_1 m_2}} + \sqrt{\frac{m_1 m_2}{M_1 M_2}} \right) \sum_{i=1}^n \|(T^2 S^2)^{1/2} \xi_i\|^2 .
\]

**4. A Grüss type inequality.** In this section we obtain another Grüss type inequality, see also [18]. Let \( \mathcal{A} \) be a \( C^* \)-algebra and let \( \mathcal{B} \) be a \( C^* \)-subalgebra of \( \mathcal{A} \). Following [1], a positive linear map \( \Phi : \mathcal{A} \to \mathcal{B} \) is called a left multiplier if \( \Phi(XY) = \Phi(X)Y \) for every \( X \in \mathcal{A}, Y \in \mathcal{B} \).

The following lemma is interesting on its own right.
Lemma 4.1. Let $\Phi$ be a unital positive linear map on $\mathcal{A}$, $A \in \mathcal{A}$ and $M, m$ be complex numbers such that
\[ \text{Re}((M - A)^*(A - m)) \geq 0. \] (4.1)
Then
\[ \Phi(|A|^2) - |\Phi(A)|^2 \leq \frac{1}{4}|M - m|^2. \]

Proof. For any complex number $c \in \mathbb{C}$, we have
\[ \Phi(|A|^2) - |\Phi(A)|^2 = \Phi(|A - c|^2) - |\Phi(A - c)|^2. \] (4.2)
Since for any $T \in \mathcal{A}$ the operator equality
\[ \frac{1}{4}|M - m|^2 - \left| T - \frac{M + m}{2} \right|^2 = \text{Re}((M - T)(T - m)^*) \]
holds, the condition (4.1) implies that
\[ \Phi \left( \left| A - \frac{M + m}{2} \right|^2 \right) \leq \frac{1}{4}|M - m|^2. \] (4.3)
Therefore, it follows from (4.2) and (4.3) that
\[ \Phi(|A|^2) - |\Phi(A)|^2 \leq \Phi\left(|A - \frac{M + m}{2}|^2\right) \leq \frac{1}{4}|M - m|^2. \]
\[ \square \]
Remark 4.2. If (i) $\Phi$ is a unital positive linear map and $A$ is a normal operator or (ii) $\Phi$ is a 2-positive linear map and $A$ is an arbitrary operator, then it follows from [3] that
\[ 0 \leq \Phi(|A|^2) - |\Phi(A)|^2. \] (4.4)
Condition (4.4) is stronger than positivity and weaker than 2-positivity; see [8]. Another class of positive linear maps satisfying (4.4) are left multipliers, cf. [1, Corollary 2.4].

Lemma 4.3. Let a positive linear map $\Phi : \mathcal{A} \to \mathcal{B}$ be a unital left multiplier. Then
\[ |\Phi(A^*B) - \Phi(A)^*\Phi(B)|^2 \leq \|\Phi(|A|^2) - |\Phi(A)|^2\| \,(\Phi(|B|^2) - |\Phi(B)|^2) \] (4.5)
Proof. If we put \([X, Y] := \Phi(X^*Y) - \Phi(X)^*\Phi(Y)\), then \(\mathcal{A}\) is a right pre-inner product \(C^*\)-module over \(\mathcal{B}\), since \(\Phi(X^*Y)\) is a right pre-inner product \(\mathcal{B}\)-module, see [1, Corollary 2.4]. It follows from the Cauchy–Schwarz inequality in pre-inner product \(C^*\)-modules (see [15, Proposition 1.1]) that
\[
|\Phi(A^*B) - \Phi(A)^*\Phi(B)|^2 = [B, A][A, B]
\leq \|[A, A]||[B, B]
= \|\Phi(A^*A) - \Phi(A)^*\Phi(A)\| \|\Phi(B^*B) - \Phi(B)^*\Phi(B)\|
\]
and hence (4.5) holds.

5. Ozeki–Izumino–Mori–Seo type inequality. Let \(a = (a_1, \ldots, a_n)\) and \(b = (b_1, \ldots, b_n)\) be \(n\)-tuples of real numbers satisfying

\[
0 \leq m_1 \leq a_i \leq M_1 \quad \text{and} \quad 0 \leq m_2 \leq b_i \leq M_2 \quad (i = 1, \ldots, n).
\]

Then Ozeki–Izumino–Mori–Seo inequality [12, 22] asserts that

\[
\sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2 - \left(\sum_{i=1}^{n} a_i b_i\right)^2 \leq \frac{n^2}{3} (M_1 M_2 - m_1 m_2)^2. \tag{5.1}
\]

In [12] they also showed the following operator version of (5.1): If \(A\) and \(B\) are positive operators in \(\mathbb{B}(\mathcal{H})\) such that \(0 < m_1 \leq A \leq M_1\) and \(0 < m_2 \leq B \leq M_2\) for some scalars \(m_1 \leq M_1\) and \(m_2 \leq M_2\), then

\[
(A^2 x, x)(B^2 x, x) - (A^2 B^2 x, x)^2 \leq \frac{1}{4\gamma_2} (M_1 M_2 - m_1 m_2)^2 \quad \tag{5.2}
\]
for every unit vector $x \in H$, where $\gamma = \max\{\frac{m_1}{M_1}, \frac{m_2}{M_2}\}$.

Based on the Kantorovich inequality for the difference, we present an extension of Ozeki–Izumino–Mori–Seo inequality (5.2) as follows.

**Theorem 5.1.** Suppose that $\Phi : B(H) \rightarrow B(K)$ is a positive linear map such that $\Phi(I)$ is invertible and $\Phi(I) \leq I$. Assume that $A, B \in B(H)$ are positive invertible operators such that $0 < m_1 \leq A \leq M_1$ and $0 < m_2 \leq B \leq M_2$ for some scalars $m_1 \leq M_1$ and $m_2 \leq M_2$. Then

$$
\Phi(B^2)^{\frac{1}{2}}\Phi(A^2)^{\frac{1}{2}} - |\Phi(B^2)^{\frac{1}{2}}\Phi(B^2)^{\frac{1}{2}}| \leq \left(\frac{M_1 M_2 - m_1 m_2}{4}\right) \times \frac{M_2^2}{m_2^2} \tag{5.3}
$$

and

$$
\Phi(A^2)^{\frac{1}{2}}\Phi(B^2)^{\frac{1}{2}} - |\Phi(A^2)^{\frac{1}{2}}\Phi(A^2)^{\frac{1}{2}}| \leq \left(\frac{M_1 M_2 - m_1 m_2}{4}\right) \times \frac{M_1^2}{m_1^2} \tag{5.4}
$$

**Proof.** Define a normalized positive linear map $\Psi$ by

$$
\Psi(X) := \Phi(A)^{-\frac{1}{2}}\Phi(A^2 X A^2)\Phi(A)^{-\frac{1}{2}}.
$$

By using the Kantorovich inequality for the difference, it follows that

$$
\Psi(X^2) - \Psi(X)^2 \leq \frac{(M - m)^2}{4} \tag{5.5}
$$

for all $0 < m \leq X \leq M$ with some scalars $m \leq M$. As a matter of fact, we have

$$
\Psi(X^2) - \Psi(X)^2 \leq \Psi((M + m)X - Mm) - \Psi(X)^2
$$

$$
= - \left(\Psi(X) - \frac{M + m}{2}\right)^2 + \frac{(M - m)^2}{4}
$$

$$
\leq \frac{(M - m)^2}{4}.
$$

If we put $X = (A^{-\frac{1}{2}} B A^{-\frac{1}{2}})^{\frac{1}{2}}$, then due to

$$
0 < (m =) \sqrt{\frac{m_2}{M_1}} \leq X \leq \sqrt{\frac{M_2}{m_1}} (= M)
$$

we deduce from (5.5) that

$$
\Phi(A)^{-\frac{1}{2}}\Phi(B)^{\frac{1}{2}}\Phi(A)^{-\frac{1}{2}} - \left(\Phi(A)^{-\frac{1}{2}}\Phi(A^2 B)\Phi(A)^{-\frac{1}{2}}\right)^2 \leq \left(\frac{\sqrt{M_1 M_2} - \sqrt{m_1 m_2}}{4M_1 m_1}\right)^2.
$$
Pre- and post-multiplying both sides by $\Phi(A)$, we obtain

$$\Phi(A)^{\frac{1}{2}} \Phi(B) \Phi(A)^{\frac{1}{2}} - |\Phi(A)^{-\frac{1}{2}} \Phi(A^2 B) \Phi(A)^{\frac{1}{2}}|^2 \leq \left( \frac{\sqrt{M_1 M_2} - \sqrt{m_1 m_2}}{4 M_1 m_1} \right)^2 \Phi(A)^2 \leq \left( \frac{\sqrt{M_1 M_2} - \sqrt{m_1 m_2}}{4 m_1} \right)^2 \frac{M_1}{m_1},$$

since $0 \leq \Phi(A)^2 \leq M_1^2$. Replacing $A$ and $B$ by $A^2$ and $B^2$ respectively, we have the desired inequality (5.4). Similarly, one can obtain (5.3). □

**Remark 5.2.** If $\Phi$ is a vector state in (5.3) and (5.4), then we get Ozeki–Izumino–Mori–Seo inequality (5.2).
